DATA PLAN · ONE PAGE

How we'd build your analytics platform

One trusted view of revenue, ad spend, profit and creative performance across every store.

Demo · mock data

1 · ARCHITECTURE

Shopify Admin API
Meta Marketing API
Google Ads API

→ **Scheduled sync jobs** — Node workers pull new + changed data every hour, full re-check nightly

→ **Raw tables (Postgres)** — An untouched copy of what each API returned, kept for audits

→ **Clean, modelled tables** — One row per order, per ad per day, in EUR and store time

→ **Next.js dashboard** — Fast, filterable screens like this demo, on your own login

2 · ACCURACY RULES

- **Shopify is the source of truth for revenue.** Ad platforms' own revenue is shown next to it, never instead of it.
- **No duplicates.** Orders are keyed by order ID; ad data by ad ID + date. Re-running a sync updates rows, it never adds copies.
- **Full history.** We backfill everything the APIs allow on day one, then keep it, even if the platform later drops it.
- **Rate limits and pagination handled.** Jobs page through every result, slow down when asked and retry failures automatically.
- **One currency, the right day.** Everything converted to EUR at the daily rate; each store's day follows its own timezone.
- **Checks you can see.** Daily totals are compared with Shopify and Ads Manager; any gap above 1% gets flagged.

3 · DEFINITIONS TO AGREE ON DAY 1

Winner rule	e.g. ROAS ≥ 2.0 after ≥ €300 spend within 7 days
Profit	revenue − COGS − ad spend − fees (payment, shipping, apps)
Attribution window	e.g. Meta 7-day click / 1-day view
Store vs total	which costs are shared, and how they're split per store

4 · AD NAMING CONVENTION

Every ad is named `strategist_angle_product_version`

`AH` strategist _ `ugc-pain` angle _ `serum` product _ `v3` version

The sync reads the name, so win rates per strategist and angle appear automatically. Names that don't match get flagged in a weekly list instead of silently ignored.

5 · PHASES

1 Audit + data rules
Walk through your reference dashboard, agree every definition above, map each metric to its source.

2 Syncs + database
Connect all stores and ad accounts, backfill history, run accuracy checks against the platforms.

3 Overview + creative screens
Revenue, spend, ROAS, profit by store and period; creative and strategist performance.

4 Advanced insights
Angle analysis, winning-creative patterns, cross-store / product / campaign comparisons.

You get a working screen at the end of every phase, on real data, so you can check the numbers against what you already trust before we build further.
